
Scheduling your soil samples for Asbestos testing

Envirolab dry and crush your soil samples in advance of undertaking some of the testing you request.

It isn't uncommon for clients to ask us to test for Asbestos after we have already begun other tests, running the risk that we may have already dried and crushed the sample in question.

We like to work with the confidence that clients have identified the risk of samples containing Asbestos before or during siteworks and our procedures differ when Asbestos is scheduled. Such procedures minimise the risk of exposure to Asbestos fibres for our staff.

If Asbestos testing is requested after other testing has been scheduled then we may not have been able to minimise that risk. If Asbestos testing is requested at the same time as the initial testing for the samples in question we will be able to minimise that risk.

Please consider if there is a risk of Asbestos being present in your samples and request an "Asbestos in soil" test if the risk exists.

As well as helping us protect our staff you may also be avoiding some nasty surprises further down the line for your project.

If you have any questions regarding your testing, do not hesitate to contact us.
